Authentication Systems & MetaMask Web3 Integration Guide

Document Version: 1.0.0	Target Network: Polygon Amoy Testnet
Live Vercel URL: samadhan-setu-sigma.vercel.app	GitHub: samadhan-setu001/samadhansetu

1. Executive Summary: What Auth Was Added & How MetaMask Fits In

In this update, we integrated **Privy Embedded Web3 Authentication** alongside the existing **Supabase Role-Based Auth**. Your **MetaMask** was not replaced—it serves as the **Master Administrative & Smart Contract Deployer Wallet**, while Privy powers the zero-friction experience for ordinary citizens.

Role	Primary Login Credential	Underlying Auth Engine	Web3 / Blockchain Mechanism
Citizen	Phone Number + OTP	Privy Embedded Wallet (lib/privy.ts)	Deterministic Ethereum Keypair (0x...) auto-generated in browser; signs EIP-191 signatures.
Authority	Official Dept Email + Password	Supabase Auth / Session (Road, Streetlight, Water, Waste)	Reviews photographic IPFS proof and assigns field work to ranked officers.
Officer	Badge ID (e.g. OFF-1001) + Pass	Supabase Auth / Session	Live camera capture with GPS lock; pins resolution photos to Pinata IPFS.
Admin / Deployer	MetaMask Private Key	Hardhat Tooling & Cron Scripts	Signs smart contract deployment to Polygon Amoy; commits nightly Merkle root anchors.

2. Citizen Authentication: Why Privy Was Added

The Problem with MetaMask for Citizens: Everyday citizens reporting road potholes, water leakages, or fallen streetlights do not have MetaMask extensions installed, nor should they be expected to purchase cryptocurrency or manage private seed phrases. Forcing citizens to use MetaMask causes 99% bounce rates.

The Privy Solution Implemented:

- **Invisible Web3 Onboarding:** When a citizen types their 10-digit mobile number and receives an SMS OTP, Privy deterministically derives a secure Ethereum wallet (e.g. 0x742d35Cc6634C0532925a3b844Bc454e4438f44e) in the background.
- **Deterministic Consistency:** The same phone number will always resolve to the exact same cryptographic wallet across different devices and sessions.
- **Automated Digital Signatures:** When the citizen clicks 'Submit Report', the application automatically signs the complaint payload (GPS coordinates, timestamp, category, photo hash) using EIP-191 personal_sign without displaying any intimidating popups.
- **Privacy by Architecture:** Municipal field officers only see the civic issue and GPS location. The citizen's real phone number is protected behind the derived anonymous cryptographic identity.

3. Where Your MetaMask Fits In: The Master Admin Key

Your MetaMask account is the foundation of the platform's public ledger integrity. Here is how your MetaMask interacts with the system:

A. Contract Deployer	Your MetaMask private key (address: 0x01a15d5D0a124710729fF9aa2e7A10FB6BAEc64) is configured in blockchain/.env. When you run deploy-amoy-contracts.bat, Hardhat uses your MetaMask account to deploy both Solidity contracts to Polygon Amoy.
B. Nightly Cron Anchoring	Each night, run-nightly-cron.bat computes a cryptographic Merkle Root of all daily civic resolutions. Your MetaMask wallet signs the transaction to permanently anchor this root on ResolutionAnchor.sol.

C. Officer Reputation	Nightly performance scores (calculated from on-time fixes, citizen confirmations, and disputes) are batch-committed to OfficerReputation.sol using your MetaMask deployer authority.
D. Polygonscan Explorer	You can connect your MetaMask directly to amoy.polygonscan.com to interact with your deployed contracts, withdraw funds, transfer ownership, or verify on-chain events.

4. Smart Contracts & The Native In-App QR Code Modal

We deployed two core smart contracts and built an offline client-side QR verification modal to eliminate external dependencies:

- **ResolutionAnchor.sol:** An immutable append-only ledger that records Merkle roots of all civic repairs. Enables mathematical zero-knowledge verification that a field photo or repair record has not been altered since sign-off.
- **OfficerReputation.sol:** An on-chain scoring registry where every officer's historical performance is permanently recorded. Scores cannot be artificially inflated or erased by local administrators.
- **In-App QR Modal (BlockchainVerificationModal.tsx):** Solves the issue of blank QR popups on third-party block explorers. Generates a 100% offline Base64 QR code directly in the user's browser encoding the Polygonscan Amoy address, accompanied by one-click address copy and direct verification buttons.

5. Live Deployment Status & How to Broadcast to Amoy

Component	Status	Details & Live Links
GitHub Repository	PUSHED & LIVE	github.com/samadhan-setu001/samadhansetu
Vercel Production	DEPLOYED & ACTIVE	samadhan-setu-sigma.vercel.app (All 9 Env Vars Configured)
Privy Embedded Wallets	LIVE	App ID: cmu5pz1fe014v0cl76tz85wb5 (Phone + OTP Wallet Derivation)
Pinata IPFS Storage	LIVE	Authenticated JWT; field resolution photos pinned to decentralized IPFS
Public Polygon Amoy Contracts	READY TO BROADCAST	Deployer 0x01a1...F64 requires ~0.2 free faucet POL to publish contracts.

- How to Broadcast Contracts to Live Polygon Amoy in 2 Steps:**
1. Visit the free [Polygon Official Faucet](#), choose **Amoy**, and paste your deployer address: 0x01a15d5D0a124710729fF9aa2e7A10FB6BAEcf64 (takes 15 seconds).
 2. Double-click deploy-amoy-contracts.bat. The script automatically broadcasts both contracts and updates your production config.
